MDNUniversity continues to fill the growing need for glucose management information. We are pleased to present the following online learning programs ...

NEW! Implementing Successful Glucose Management from a CDE's Perspective

The evidence supporting inpatient glucose management for improving clinical outcomes continues to grow. You have heard experts warn of the dangers of both hyper- and hypoglycemia in critically ill patients. You may have volunteered or been chosen for a glucose management team. Taking the initiative will benefit your patients, your hospital, and your career. You know it's the right thing to do. What to do next?

Protocols and processes have to be implemented and tools have to be purchased. Staff members have to be trained. Results have to be measured. You can't do it alone. You'll need to enlist the support of a variety of cross-functional teams in your hospital – nurses, physicians, pharmacists, administrators, dieticians, and laboratorians. This clear and concise MDNU webinar will show you how to tailor your message to their priorities and objectives.

Webinar speaker: Joni Carroll, RN, Certified Diabetes Educator at Indiana University/Clarian Health. Ms. Carroll is a veteran glucose management champion and trainer. She has assembled one of the largest and most successful glucose management teams in the country. In this one hour webinar, she shares her skillful "what you say to whom" techniques to get the right people on board and committed to successful glucose control in your hospital.

Controlling Hyperglycemia: The Evidence. The Research. The Strategies.

(The response to Dr. Juneja's webinar was so overwhelming that he will repeat this series for the last time. Register today and bring your colleagues!)

Inpatient hyperglycemia has everyone's attention. Hospitals everywhere have either made or will soon be making the commitment to control glucose levels in an effort to improve patient outcomes. If your hospital has already implemented a protocol, it's likely to have faced one challenge after another in implementing it. But the benefits to patients are worth the effort. This 3-part, webinar series will discuss:

- Part 1: The considerable evidence supporting the benefits of controlling glucose in critically ill patients, as well as the incidental studies that suggest only marginal or insignificant improvement.
- Part 2: The compelling research supporting the implementation of glucose management programs, identifies the obstacles to their implementation, and suggests the most practical paths to evade these obstacles.
- Part 3: The strategies that simplify the shift toward effective glucose management and overcome the inertia that impedes positive change.
